

Therapeutic Listening

What is Therapeutic Listening?

Therapeutic Listening is a structured program using specially designed music for children who have difficulty processing sensory information, listening, attention, and communication. It emphasizes integration of the auditory and vestibular systems. Therapeutic Listening can help with coordination of left and right body-sides or hands and feet for participation in athletics and/or pre-driving practice.

How does Therapeutic Listening work?

The specifically designed and selected music is used to stimulate the nervous system. The music causes the muscles in the middle ear to contract; helping to discriminate the modulate sound input.

The tiny bones in the middle ear will vibrate when sound is provided, stimulating the movement (vestibular) and hearing (auditory) sensory receptors in the ear. The sensory information is sent throughout the central nervous system to facilitate an appropriate response.

Children with the following can benefit from Therapeutic Listening.

- Sensory Processing Disorders**
- Difficulties with Attention**
- Difficulties Communicating**
- Impulsive Behavior**
- Clumsiness**
- Motor Coordination**
- Sleep Regulation**
